TF90LVDS032 / TF90LVDT032

Quad LVDS Line Receivers with Extended Common Mode

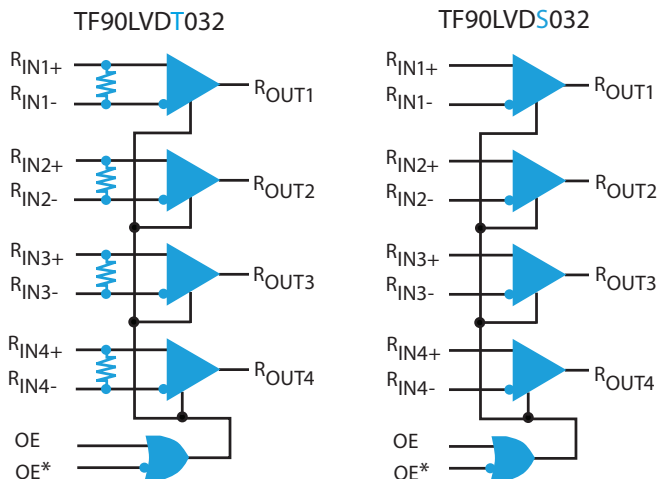

Features

- **Extended input common mode voltage range: -7V to 12V**
- **DC to 400 Mbps / 200 MHz low noise, low skew, low power operation**
 - 400 ps (max) channel-to-channel skew
 - 300 ps (max) pulse skew
 - 7 mA (max) power supply current
- **On-chip 100Ω input termination minimizes return loss, component count and board space (TF90LVDT032 only)**
- **Open or undriven fail-safe support (TF90LVDS032)**
- **LVDS inputs conform to TIA/EIA-644-A standard**
- **Standard output enable scheme eliminates power consumption when device is not in use**
- **Guaranteed operation within industrial temperature range -40° to +85°C**
- **Available in space saving SOIC-16 and TSSOP-16 packages**
- **Pin and function compatible with DS90LV032A and SN65LVDS32 and SN65LVDS32B**

Applications

- Digital Copiers
- Wireless Base Stations
- Telecom / Datacom
- Network Routing
- Laser Printers
- LCD Displays

Description

The TF90LVDS032 and TF90LVDT032 are 400 Mbps Quad LVDS (low voltage differential signaling) Line Receivers optimized for high-speed, low power, low noise transmission over controlled impedance (approximately 100Ω) transmission media (e.g. cables, printed circuit board traces, backplanes).

The TF90LVDS032 and TF90LVDT032 accept four LVDS signals and translates them to four LVCMOS signals. Their outputs can be disabled and put in a high-impedance state via two enable pins, OE and OE*.

The TF90LVDS032 and TF90LVDT032 input receivers support wide input voltage range of -7 V to 12 V for exceptional noise immunity. A fail-safe feature sets the outputs to a high state when both inputs are open, or undriven.

The TF90LVDT032 features on-chip 100Ω input termination resistors that minimize input return loss, component count and board space. The TF90LVDS032 differential inputs are without input termination resistors and are suitable for applications requiring custom termination schemes.

Supply current is 7 mA (max). LVDS inputs conform to the ANSI/EIA/TIA-644-A standard. The TF90LVDS032 and TF90LVDT032 are offered in 16-pin SOIC(N) and TSSOP packages and operate over an extended -40 °C to +85 °C temperature range.

¹ Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

I_{CC}	Power supply current	OE = 1 or OE* = 0 Not switching		5	7	mA	
I_{CCZ}	Power supply current with disabled outputs	OE = 0 and OE* = 1		1	2	mA	

NOTE1 Current into device pin is defined as positive. Current out of the device is defined as negative. All voltages are referenced to ground, unless otherwise specified.

NOTE2 This specification is not production tested and is guaranteed by design simulations.

NOTE3 Output short circuit current (I_{OS}) is specified as magnitude only. The minus sign indicates direction only. Only one output should be shorted at a time, do not exceed maximum junction temperature specification. Specified for momentary short condition durations only.

NOTE4 Recommended operating conditions for the R_{IN+} and R_{IN-} pins is over the range of -7.0V to 12.0V. Therefore, caution should be taken not to exceed these values or the maximum Differential Input voltage of 1.0V.

Switching Characteristics

Over recommended operating conditions, unless otherwise specified. Typical values are at $V_{CC} = 3.3V$, $T_A = 25^\circ C$.

f_{MAX}	Maximum operating frequency (NOTES 11 and 12)	Figure 1 $C_L = 15pF$		200		MHz

NOTE5 Generator output characteristics (unless otherwise specified): $f = 1 MHz$, $Z_o = 50\Omega$, $t_r < 1 ns$, $t_f < 1 ns$.

NOTE6 All input voltages are for one channel unless otherwise specified. Other inputs are set to GND.

NOTE7 Switching Characteristic specifications are not production tested and are guaranteed by statistical analysis of characterization data.

NOTE8 $t_{SK(p)}$ pulse skew, is the magnitude difference in propagation delay time between the positive going edge and the negative going edge of the same channel ($t_{SK(p)} = |t_{PLH} - t_{PHL}|$).

NOTE9 $t_{SK(c-c)}$ channel-to-channel skew, is the difference in propagation delay time between channels on the same device at any operating temperature and supply voltage.

NOTE10 $t_{SK(p-p)}$ part-to-part skew, is the difference in propagation delay time between devices operating at the same power supply voltage and within $5^\circ C$ of each other within the operating temperature range.

NOTE11 Generator output characteristics for the f_{MAX} : $Z_o = 50\Omega$, $t_r = t_f < 1 ns$, 50% duty cycle, 1.05V to 1.35V peak to peak. Output Criteria: 60%/40% duty cycle, VOL (max 0.4V), VOH (min 2.7V).

NOTE12 The capacitive load C_L includes test fixture, probe and lumped capacitance.
